1 Getting started

1.1 Install AccLab

- To use the ltl prover, you need to put the following executable files (tspass, fotl-translate) in tools/your platform/ (linux/mac/win)
- Basic run: python aalc.py (you need python 3.4.0 or greater)
- Run an AAL file: python aalc.py-i testfile.aal

1.2 Using AAL compiler "aalc"

Listing 1: aalc options

```
aalc
 -h
        --help
                                  display this help and exit
  -i
        --input
                                  the input file
        --output
 -i
                                  the output file
        --compile
                                  compile the file, that can be loaded after using -l
 -c
  -m
        --monodic
                                  apply monodic check on aal file
 -s
        --shell
                                  run a shell after handling aal program
                                  perform a verbose check
        --check
 -k
 -1
        --load
                                  load a compiled aal file (.aalc) and run a shell
 -t
        --fotl
                                  translate the aal program into FOTL
 -r
        --reparse
                                  reparse tspass file
 -r
        --recompile
                                  recompile the external files
 -b
        --no-colors
                                  disable colors in output
  -x
        --compile-stdlib
                                  compile the standard library
        --hotswap
 -d
                                  enable hotswaping (for development only)
                                  show ast tree
```

1.3 Writing your first AAL program

Let consider the following senario, we have three actors:

- cloud storage service: let call it css which is a cloud service provider
- alice and bob: an end users that uses css service

The css offers the following services: read (a user reads some data form css server), store (a user stores some data into css server), delete (a user deletes some data from css server). css allows users to read/store/delete only their data on his server, and don't allow them to read other customers data. css can also read and delete any data from his server.

Alice want to check if **css** policy respect her privacy. Typically she want to know if she is allowed to performs some actions and if bob can read here data.

a. **Declaring services** The services are the

```
SERVICE read
SERVICE store
SERVICE delete
```

b. **Declaring actors**: first we need to declare our actors

```
// Agents declaration
AGENT alice
AGENT bob
AGENT css
```

c. Linking services and actors First we need to declare our actors

```
AGENT alice TYPES() REQUIRED(read store delete) PROVIDED()
AGENT bob TYPES() REQUIRED(read store delete) PROVIDED()
AGENT css TYPES() REQUIRED() PROVIDED(read store delete)
```

d. **Defining policies** First we need to declare our actors

```
* Cloud storage service provider policy
CLAUSE css_policy (
   FORALL d:data FORALL a:Actor
    // Allow users to read their data
    IF (d.subject == a) THEN {
        PERMIT a.read[css](d)
   } AND
    // Deny access to read other
    IF (d.subject != a) THEN {
       DENY a.read[css](d)
   } AND
    // Allow css to read/delete stored data
   PERMIT css.read[css](d) AND
   PERMIT css.delete[css](d)
)
* Alice's preferences
CLAUSE alice_policy (
   FORALL d:data
    // Alice want to be able to read all her data stored on css
   IF (d.subject == alice) THEN {
        PERMIT alice.read[css](d)
)
```

e. Writing checks Now we want to check if Alice's privacy preferences are respected by the css policy. To do this, we can call the macro validate and passing the the clauses names as arguments. Important: Note that the order of arguments is important.

```
CALL validate("css_policy" "alice_pref")
```

1.4 Running the program

• Run the AAL program

```
root@root/:$ python aalc -i examples/tuto0.aal
```

```
Monodic check passed !
   ------ Starting Validity check ------
  c1 : css_policy
  c2 : alice_pref
  ---- Checking c1 & c2 consistency :
   -> Satisfiable
  ---- Checking c1 => c2 :
   -> Satisfiable
  ---- Checking ~(c1 => c2) :
   -> Unsatisfiable
  [VALIDITY] Formula is valid !
  ------ Validity check End ------
 File : examples/tuto0.aal
 Execution time : 0.24277639389038086
  Here the result of
• Perform an detailed check
 root@root/:$ python aalc -i examples/tuto0.aal -k
  ----- Start Checking -----
  ** DECLARATIONS
  [DECLARED AGENTS]
                  : 3
  [DECLARED SERVICES] : 6
  [DECLARED DATA]
                 : 0
  [DECLARED TYPES]
                  : 10
  *** Forwards references check
  [AGENTS]
         : 0
  [SERVICES] : 0
  [DATA]
          : 0
  [TYPES]
          : 0
  ** LOADED libraries
  [LIBS] : 2
  ** CLAUSES
  [CLAUSES] : 2
 {\tt Monodic\ test:}
  |css_policy | Formula is monodic ! |
  |alice_pref | Formula is monodic ! |
  ----- Checking End -----
• Perform monodic test on all clauses :
  root@root/:$ python aalc -i examples/tuto0.aal -m
  ----- Start Checking ------
  |css_policy | Formula is monodic ! |
  |alice_pref | Formula is monodic ! |
```

• Translate AAL program into FOTL (in tspass syntax):

```
root@root/:$ python aalc -i examples/tuto0.aal -t
----- FOTL Translation start -----
%%%%%%%%% START EVN %%%%%%%%%%%%%%

("subject(d, a) => "Pread(a, css, d))) & Pread(css, css, d)) & Pdelete(css, css, d)))))) )
%% Clause : alice_pref
always(![d] ( data(d) & ( (subject(d, alice) => Pread(alice, css, d)))) )
   ----- FOTL Translation end ------
```

1.5 Using core libraries

You can load external AAL files using LOAD "aal_file"(without the extension)

core.types Contains the basic types declarations (Actor, DataSubject, DataController, DataProcessor, ...)

```
LOAD "core.types"
```

core.macros Contains some useful macros.

```
// Loading lib
LOAD "core.macros"
```

1.6 Advanced checks

dzd

1.7 Using the shell

The shell is a useful tool for developing

• Run the shell.

```
aalc -i examples/tuto1.aal -s
/* Result :
shell >
*/
```

• Type help to show the shell help.

```
Shell Help
 - call(macro, args)
                                                                                                                                                                                                 call a macro where /
                                                                        *macro : is the name of the macro % \left( 1\right) =\left( 1\right) \left( 1\right
                                                                        *args : a list of string; << ex : ["'args1'", "'args2'", ..."'argsN'"] >>
                                                                                                                                                                                                 show all declared clauses in the loaded aal program
